We are excited to announce that the new Physical Science Bridge will be lifted and set in place on Tuesday, July 19, 2016. The crane will arrive on site at approximately 7am. The bridge is then scheduled to be lifted and placed between 11am and noon, and will take approximately 10 minutes. The crane will be staged on the north side of the creek; we, therefore, recommend that spectators view from the south side of the creek, outside of the construction fencing. Please note that the date and times are tentative, as they are contingent upon the completion of other activities. We will update this notification if the date changes.

The contractor will have Sol Wil Le No Way closed for a good portion of the morning and early afternoon. The actual lifting of the bridge will not take long, but the setting up and then de-mobilizing of the crane are very time consuming.

Once the bridge is in place, there will still be work to do on the connections and pathways on the north and south sides of the bridge that will continue into the fall semester. The bridge will not be usable until all work is complete. It is estimated this will be by the beginning of October 2016.

Thank you for your patience during construction. For questions regarding the construction, please contact Planning, Design & Construction at x6235.
